

FOBRO Pick-Up Plant Harvester

The FOBRO Pick-Up Plant Harvester built to pick up any bareroot stock, seedlings or transplants grown in beds, rows or broadcasted. Hardwoods and conifers, as well as most shrubs, berries and perennials are picked up and conveyed gently. The FOBRO Pick-Up Plant Harvester can be individualized to fit different logistic systems. The plants can be stacked directly into pallets riding on the back of the Harvester or conveyed sideways into pallets on a wagon riding parallel. The digging, lifting and shaking is done either with the new FOBRO Super Max, the well known FOBRO Super HD or the FOBRO 2000 lifter/shaker

FOBRO Pick-Up Plant Harvester

Adjustable quick coupling system to attach or detach the Pick-Up from the Lifter/shaker. This allows very tight turning radius. Once in the row and straightened out the Goose-neck coupling is retractable.

In operation the Goose-neck is retracted to allow plants easily to flow from the Lifter/shaker directly onto the pick-up tines. This guarantees that every plant is picked up.

Unique Pick-Up system with special tines that retract before the drop off point. No plants can be tangled and/or twisted around shafts. The plants are picked up from underneath. No damage like stripping and squeezing can occur.

The side conveyor just folds backwards and around for street transport. Its height and conveying speed is adjustable hydraulically.
