

## FOBRO special seed drill

FOBRO seed drill for all types of seed. The seed can range in size from Poppy, Spinach, Salad, Conifers, Cherry and Acorn. The precise seeder allows for broadcast, drilled and band placement of coated and natural seed. This is the ideal seeder for seeds with germination rates typically found in Horticultural crops.

The FOBRO seeder is available in a variety of models to fit your needs, such as, 3-point hitch mounts to self propelled walk behinds for field and greenhouse applications.

Available in applications with up to 18 rows per seed bed.

The same seeding mechanism can also be used to spread granules like the soil sterilant BASAMID).

# FOBRO special seed drill

## Advantages in detail:

The compact design with a wide base makes it possible to seed extremely close to the edge of a greenhouses or tunnel.

Easy calibration of seed density is done with a hand crank. One turn on the handle equals one linear meter.

The seed rate is calibrated with one lever from zero to 35 on a scale. The special, step less speed variator allows calibration for the smallest seed quantities up to the flow of 500 kg of granules per hectare, such as would be used with the soil sterilant BASAMID.

The feed roller shaft can be changed quickly and easily just by loosening two wing-nuts.

There is a revolving agitator just above the feed roller to prevent seed from bridging and clogging the system.

Sowing depth is centrally adjusted with a single hand crank. Seed drill coulters are guided by a spring loaded parallelogram mounting system with two self cleaning stainless steel rollers.

Appropriately sized seed coulters are fixed to the coulters bar which are fully adjustable. Different coulters and covers can be mounted to the seeder depending of the application requirements.
